Engineering leader · 25+ years shipping production software · Gives engineering teams AI superpowers, safely

SUMMARY

I do not believe in replacing engineers. I believe in giving them superpowers. Over 25 years and three Director of Engineering roles I have shipped production systems in aviation, IoT, and enterprise AI. For the last year at Parslee.AI I have run engineering through AI agent fleets that the whole team directs, and the results are measurable: in the 30 days to October 9, 2026, work I directed accounted for 505 of the 992 pull requests merged across the company, up from 59 a year earlier, with zero reverts in our two main codebases. The output grew nine times. Risk did not. Every change passes an independent reviewer agent, automated test, lint, and supply-chain gates, and a person decides when a release goes live. I built the framework as a template any engineer can install, and teammates adopted it. I can bring that system, and the habits behind it, to an engineering organization so that every engineer produces at a multiple of what they deliver today, with the quality bar going up, not down.

WHAT I BRING TO AN ENGINEERING ORGANIZATION

- **A proven multiplier, not a replacement.** The same engineers, producing roughly nine times the merged output within a year. 83% of that work came from agent fleets that engineers direct; the engineers set the goals, the acceptance checks, and the product calls. Work merged on 29 of 30 days, 29% of it overnight while the team slept.
- **Speed that stays safe.** A separate reviewer agent that never reviews its own work checks every change. Automated test, lint, and supply-chain checks must pass before anything merges. Releases go live only when a person switches them on. None of the 466 changes merged into our two main codebases in that 30-day window was reverted.
- **A system the whole team owns.** Wheelhouse, a public template, installs a fleet (lead, builder, reviewer, checker agents) into any repository. goalpool lets teammates queue work to agents and track it remotely across multiple AI subscriptions. Fleets now run in five codebases and other engineers run them without me. When an agent repeats a mistake, the fix goes into the team's shared rules and checks, so the lesson compounds instead of being relearned.
- **Engineering judgment that scales.** The review comments senior engineers used to leave by hand now live in tests, lint rules, and shared contracts, so every agent and every new hire starts from the team's best judgment on day one.
- **Low, flat cost.** Four fleets run on about $1,800 a month in flat-rate subscriptions, merging roughly 500 pull requests in 30 days.

HOW I RUN IT

Engineers write the goal and how we will check it is done. A lead agent breaks the goal into small tasks for builder agents, and separate reviewer and checker agents test the results. People make the calls only people should make: product direction, pricing, customer and consent questions, and what ships. Engineers spend their time on architecture, judgment, and the customer, and the fleet carries the typing. I coach engineers into this way of working, one team at a time, and measure it by merged, un-reverted, customer-facing change.

PROFESSIONAL EXPERIENCE

Parslee.AI — Director of Engineering

Remote · Sep 2025 – Present

Parslee puts AI employees inside a company's Microsoft 365. Each has a role, a level of authority, and a memory, and handles email, calendar, meetings, calls, CRM, and documents.

- Direct the agent fleets that build Parslee's platform (.NET on Azure, Next.js front end) and CAR, the Common Agent Runtime that checks every proposed model action against policy before it runs. More than 3,100 pull requests merged since September 2025, 505 in the last 30 days.
- Built Wheelhouse, the fleet template the team now uses: a lead agent turns a goal and its acceptance checks into tasks, and builder, reviewer, and checker agents carry them to merged changes. Public at github.com/morebetterltd/wheelhouse.
- Built goalpool, which runs queued agent work across several AI subscriptions, moves work when one hits a limit, and lets teammates dispatch and monitor remotely.

- Ran a 117-agent audit of the team's AI-coding setup (rules, skills, hooks, background services); 41 findings, first clean-up phase independently verified 13 of 13.
- Onboarded the newest engineer onto fleet-based delivery and set the company's weekly engineering priority.

flyExclusive, Inc. — Director of Engineering Remote · Sep 2024 – Sep 2025

- Led the team [N engineers] that rebuilt the pilot mobile app from unused to installed and used regularly by every pilot.

Volato, Inc. — Director of Software Engineering Remote · 2022 – Sep 2024

- Built and led the software engineering team [N engineers] across customer, crew, and internal systems.
- Delivered Fly Vaunt, an "empty leg" flight marketplace: $1.3M+ revenue and nearly 78,000 users in year one.
- Led Volato Mobile (11,000 users in six months) and the Volato Crew App for pilot scheduling.
- Launched Volato AI, a GPT-4o sales agent inside the sales team's tools, an early version of the same idea: AI that multiplies a team instead of replacing it.
- Kept customer-facing and internal systems at near-100% uptime with monitoring dashboards and admin tooling.

Agrify, Inc. — Director of Software Engineering Remote (Burlington, MA) · 2018 – 2022

- Led the team [N engineers] building the Java IoT controllers that run Agrify's indoor farming units, with 100% unit uptime.
- Helped build Agrify Insights, award-winning farm-operations software: 90% facility utilization, 30% lower operating costs, 1.5M+ data points per customer per year.

MoreBetter, Ltd. (Releaf) — Co-founder Washington, DC · 2015 – Present (part-time)

- Built Releaf, the top-rated cannabis journal on the App Store (4.7), 100,000+ users and nearly 900,000 journal entries.
- Named inventor on US patent 11,253,195 B2. Co-authored 15 published studies with the University of New Mexico and others.

Automata Studios — Co-founder, CEO & Software Engineer Washington, DC · 2006 – 2019

- Delivered software and hardware for IBM Watson, Frank Gehry, Victoria's Secret, Barnes & Noble, Adobe, and MTV: $10M+ revenue over 12 years. Architected and built the Kids' Reader on Barnes & Noble's NOOK.

WORK YOU CAN INSPECT

- **Wheelhouse, agent-fleet template:** github.com/morebetterltd/wheelhouse
- Neo, self-improving code-reasoning engine with persistent semantic memory, co-built: github.com/Parslee-ai/neo
- A live walk-through of the fleets at work, on request

SKILLS

AI-agent fleets, Claude Code, Model Context Protocol, LLM integration · C#/.NET, TypeScript/Node.js, React/Next.js, Python/Django, Java, PostgreSQL, Cosmos DB · Azure, Microsoft 365/Graph, AWS · React Native, Swift

EDUCATION

University of Maryland, College Park: BS, Computer Science
